Abstract:

We talk about our on-going research to build integrated systems of intuitive real-world interfaces with online collaboration systems. After the short summary of our past projects including event-space information support project (ESISP), which assists participants at conferences and exhibitions, our new project called Media Exprimo is introduced. Its aim is to assist people to express their ideas in real-world workshop situation. Using our newly developed user interfaces, the users' activity with environmental information is captured, which enables to share and articulate the ideas among the participants.
